Customer Journey Map

Date	27 October 2026
Team ID	
Project Name	Global Fuel Prices and Taxation Trends: A Comprehensive Analysis
Maximum Marks	2 Marks

Customer Journey Map

This map describes how a fuel-market analyst or researcher moves from identifying a question about global fuel prices to exploring the Tableau dashboard and using its findings. It records actions, touchpoints, thoughts, feelings, process ownership, and opportunities for improvement at each stage.

Phase of Journey	Stage 1 Identify the question	Stage 2 Explore the data	Stage 3 Interpret and use insights
Actions ***What does the customer do?***	• Defines a country or fuel-price question. • Looks for petrol, diesel or LPG prices. • Wants to compare dates or countries.	• Opens the Tableau dashboard and Story. • Filters or compares countries, fuel types and periods. • Reviews tax, subsidy and crude-oil measures.	• Compares visible trends and differences. • Identifies notable countries or periods. • Uses charts to support a report or discussion.
Touchpoint ***What part of the service do they interact with?***	• Project introduction and stated business questions. • Dataset fields and country/date coverage.	• Tableau dashboard worksheets and filters. • Petrol, diesel, LPG, tax and subsidy views.	• Tableau Story and trend charts. • Country comparisons and Brent crude trend view.
Customer Thought ***What is the customer thinking?***	• “Which countries have higher fuel prices?” • “What factors should I compare?”	• “Can I compare countries on the same basis?” • “Do taxes or subsidies align with price differences?”	• “Which patterns are most important?” • “How might crude-oil movement relate to fuel prices?”
Customer Feeling ***What is the customer feeling?***	Curious, but uncertain where to begin because the dataset contains many countries, dates and variables.	More focused when the information is organized visually, but may need clear labels and consistent scales.	More confident when trends and comparisons are easy to interpret; cautious about treating correlation as proof of causation.

Customer Journey Map — Process Ownership & Opportunities

The following rows complete the same three-stage journey map. Ownership is assigned by project responsibility, not to a named person, because team-member details were not provided.

Phase of Journey	Stage 1 Identify the question	Stage 2 Explore the data	Stage 3 Interpret and use insights
Process Ownership ***Who is in the lead on this?***	Project analyst: define the question and identify relevant dataset fields and scope.	Dashboard developer / data analyst: prepare comparisons and present the data through Tableau worksheets, filters and dashboard views.	Researcher / report author: interpret charts carefully, summarize findings and communicate limitations and recommendations.
Opportunities ***How can we improve this stage?***	• State the business question clearly. • Explain country, date and fuel-type coverage. • Define units and key measures.	• Use consistent units, labels and date formats. • Provide intuitive filters and readable chart titles. • Explain tax and subsidy fields.	• Add concise insight captions to the Story. • Distinguish correlation from causation. • State data limitations and suggest further analysis.

Project insight

The Tableau dashboard and Story help users compare petrol, diesel and LPG prices across countries and time, and explore how fuel prices vary alongside Brent crude oil prices, tax percentages, subsidy levels, regions and income levels. The journey is designed to turn a large dataset into understandable comparisons while encouraging careful interpretation of trends.

Expected outcome: A user can move from a broad fuel-market question to a focused visual comparison and then communicate a supported observation. Actual causes of price differences require additional evidence beyond visual correlation.
