Problem – Solution Fit Template

Date	27 October 2026
Team ID	
Project Name	Global Fuel Prices and Taxation Trends: A Comprehensive Analysis
Maximum Marks	2 Marks

Problem – Solution Fit Template:

Problem–Solution Fit means identifying a real customer problem and checking whether the proposed solution addresses it. It helps a team understand users' needs, current behaviours, constraints and available alternatives before finalising the solution.

Purpose:

- Solve a problem in a way that fits the target users' needs.
- Improve adoption by using familiar tools and channels.
- Communicate the value of the solution clearly.
- Identify current pain points and opportunities for improvement.
- Understand the existing situation before selecting the solution.

Completed Problem–Solution Fit Canvas for this project

1. CUSTOMER SEGMENT(S) Who needs this analysis? Fuel-market analysts, researchers, policy teams and students comparing country-level fuel prices and taxation.	**6. CUSTOMER CONSTRAINTS** What limits the user? Data is spread across countries, dates and fuel types; tax and subsidy context can be difficult to compare consistently.	**5. AVAILABLE SOLUTIONS** What do they use now? Spreadsheets, separate country reports, published price tables and static charts; these can be time-consuming to compare.
2. JOBS-TO-BE-DONE / PROBLEMS What are they trying to do? Compare petrol, diesel and LPG prices; identify changes over time; examine how tax, subsidy and Brent crude relate to prices.	**9. PROBLEM ROOT CAUSE** Why does the problem exist? Multiple variables and countries must be analysed together, while raw tables alone do not clearly reveal patterns or exceptions.	**7. BEHAVIOUR** What do users do today? Filter spreadsheets, compare country figures manually, search reports and build individual charts to investigate differences.
3. TRIGGERS What prompts analysis? Fuel-price changes, rising crude oil prices, policy changes, tax differences or the need to compare countries and periods.	**10. YOUR SOLUTION** What will this project provide? A Tableau workbook with comparative charts, an interactive dashboard and a Story exploring fuel prices, Brent crude, tax, subsidies, regions and income levels.	**8. CHANNELS OF BEHAVIOUR** How do users access information? Online datasets, CSV files, Tableau Public dashboard and Story, plus a project webpage/repository for sharing results.

4. EMOTIONS: BEFORE / AFTER Before: users may feel overwhelmed by many countries, variables and inconsistent comparisons. After: clear visual comparisons help users feel more informed and confident interpreting trends.

Problem–Solution Fit — Project Assessment

Project: Global Fuel Prices and Taxation Trends: A Comprehensive Analysis

Problem identified

Fuel-price data across countries and dates contains several measures—petrol, diesel, LPG, Brent crude oil, tax percentage, subsidy level, region and income level. Reviewing these separately makes it difficult to identify meaningful differences and trends.

Proposed solution

Use the available global fuel-price dataset and Tableau visualisations to compare fuel types and countries, inspect changes over time, and explore patterns alongside taxation, subsidy levels and Brent crude oil prices. A dashboard consolidates key views and a Tableau Story presents the findings in a logical sequence.

How the solution fits the user problem

User need	How the project addresses it
Compare fuel types and countries	Country-level and fuel-type visualisations make price differences easier to review.
Understand changes over time	Trend charts show changes in fuel prices and Brent crude oil over the available date range.
Explore policy-related factors	Tax-percentage and subsidy-level views support descriptive comparisons.
Communicate findings clearly	The Tableau dashboard and Story bring related charts together with labels and context.
Recognise limits of the analysis	The project shows associations and descriptive trends; it does not prove that taxes or crude oil alone cause a price change.

Fit conclusion

The proposed Tableau-based analysis fits the identified need because it turns a large structured dataset into comparative charts, a dashboard and a Story. It supports faster exploration and clearer communication of patterns across countries, fuel types and related variables. Its conclusions should be interpreted as descriptive analysis rather than causal proof.
